TECHNICAL STAFF INTERVIEW RESPONSES (ANONYMIZED)

Participant T1 – SOC Analyst

Security is integrated into monitoring and incident response. Alerts are handled quickly, often within minutes.

Participant T2 – Developer

Security practices like MFA and access control are followed, but approval processes slow development workflows.

Participant T3 – IT Support Engineer

Users often share passwords and delay updates. Security tools exist but are not fully utilized. User resistance is common.

Participant T4 – Security Personnel

Monitoring is done using logs and SIEM systems. Most incidents are handled efficiently, but user awareness remains inconsistent.

Participant T5 – DevOps Engineer

Security is integrated into deployment pipelines, but some manual approvals slow down releases. Automating security checks would improve both compliance and efficiency.

Participant T6 – Network Security Engineer

Firewalls, VPNs, and monitoring systems are properly configured, but alerts are sometimes ignored due to high volume. Prioritization of alerts is a challenge.

Participant T7 – Security Analyst

User behavior remains the biggest challenge. Even with strong tools, human error leads to most incidents. Continuous monitoring helps, but awareness alone is not enough.
