## MANAGERS AND SUPERVISORS INTERVIEW RESPONSES (ANONYMIZED)

**Participant M1 – General Manager (IT)**

Security culture is improving but inconsistent across departments. Leadership support exists, but enforcement varies. Measurement is mainly based on incident reports rather than actual behavior. There is a lack of behavioral metrics beyond training completion.

**Participant M2 – Senior Manager (IT)**

Security culture is average and reactive. Employees sometimes bypass controls under workload pressure. Training has only partial effectiveness. KPIs are mostly based on incidents and phishing tests.

**Participant M3 – Manager (IT)**

Security practices vary across teams depending on leadership. Incident response exists but lessons learned are not shared effectively. Communication is mainly through emails and meetings.

**Participant M4 – Operations Manager (Exports)**

Security training is generic and not tailored. Employees sometimes avoid reporting issues due to fear of blame. Security processes slow down work.

**Participant M5 – Operations Manager (Imports)**

Security rules impact productivity. Violations are often ignored unless serious. Leadership influence plays a key role in compliance.

**Participant M6 – Product Manager**

Security is considered important, but often secondary to delivery timelines. Teams sometimes prioritize product releases over strict adherence to security controls. Communication about security exists but is not always followed.

**Participant M7 – Business Operations Manager**

Security awareness is present, but employees tend to follow rules only when closely monitored. There is a need for stronger enforcement and clearer accountability across departments.
